EDITOR'S NOTE

WELCOME TO THE LATEST EDITION OF CONNECT MAGAZINE

Happy New Year! We're excited to bring you the latest edition of Connect Magazine, your go-to guide in the dynamic world of technology.

In this issue, we're exploring **'Intelligent Integration'** and how it's shaping smarter systems. From our trusted suppliers - Multicomp Pro, Molex, ADI, and Labfacility – to innovative solutions like air leak inspections that boost efficiency and save energy, there's plenty to inspire and inform.

We're deeply grateful for your continued support. Your interest keeps us motivated to bring you relevant insights and helpful resources.

To stay in the loop with future editions and special offers, visit **nz.element14.com/connect-magazine#register-with-us** or sign up for our emails. And if you'd like to share your thoughts, we're always here to listen at **nz-marketing@element14.com**.

Let's continue building smarter systems and brighter futures – TOGETHER!

Intelligent Integration – Seamless Components for Smarter Systems

As we enter 2025, our commitment to driving innovation and delivering value to our partners is getting stronger than ever. In an industry where technological advancements continuously reshape every facet of business, element14 remains 'unwavering in its support of your success'. With our extensive product portfolio and expertise, we meet today's needs while positioning you for tomorrow's opportunities. We are here to drive your growth and ensure that your business stays ahead of the curve.

This issue highlights our strategic partnership with industry leaders — Multicomp Pro, Molex, ADI, and Labfacility — renowned for their expertise and dedication to advancing technology. From enhanced interconnectivity to sophisticated measurement tools, these solutions are crafted to accelerate your success in a dynamic marketplace.

Don't miss our featured article, **'Boost manufacturing** efficiency: How air leak inspections reduce energy wastage', offering actionable strategies to optimise energy use, reduce costs, and support sustainability goals.

As we forge ahead into 2025, I look forward to deepening our partnership, exploring milestones, and defining the future of innovation together. I invite you to visit our website and explore the products and resources we've carefully curated to support your goals.

Wishing you a prosperous and innovative 2025!

Weidi Zhu Vice President Sales APAC

BOOST MANUFACTURING EFFICIENCY -HOW AIR LEAK INSPECTIONS REDUCE ENERGY WASTAGE

Author: element14 Technical Marketing Team

Pneumatic, or compressed air-driven, systems are used in a wide range of applications, including automated industrial equipment, processes, and motion control across various industries. However, compressed-air systems frequently suffer from leakage, leading to energy waste, reduced productivity, increased downtime, and a higher carbon footprint.

Compressed-air systems consume around 10% of all industrial electrical consumption, or 8.8 TWh each year, resulting in CO2 emissions of 3,100 kt/year (Source: Department for Energy Security and Net Zero, UK). Addressing air leak issues is essential for improving energy efficiency, sustainability, and productivity. This article highlights the importance of air leak inspections and how advanced air leak detection equipment assists in locating and repairing leaks.

Causes of compressed air leaks

Air leaks in compressed air systems can result from various design, maintenance, and operation factors. Common causes include:

- Worn or damaged components: Continuous use leads to wear and tear on seals, gaskets, hoses, and fittings. Over time, these parts can deteriorate and develop gaps or cracks that allow air to escape. Seals and gaskets are also crucial for ensuring airtight connections, but they can become brittle or worn down, especially in high-pressure environments.
- **Improper installation:** Incorrect pipe fittings, joints, or coupling assembly can leave gaps or misalignments that allow air to escape. Poorly routed piping and installed double-ferrule compression fittings are particularly prone to leaks.
- **Poor maintenance:** Neglecting routine maintenance or delaying minor repairs on components like hoses, valves, pipes, joints, etc., can also lead to significant air loss.

• Mechanical damages and environmental effects: Vibrations from pneumatic systems, especially those with reciprocating compressors, can damage pipes and fittings. Repeated heating and cooling cycles can cause materials to expand and contract, leading to cracks or loosening of joints. Environmental factors such as moisture, extreme temperatures, or chemical exposure capies uper corrosion, increasing the risks of leaks.

Calculating the cost associated with compressed air leaks:

Compressed air systems are present in almost every industrial facility, and leaks are inevitable. In a well-maintained system, the air leakage percentage should remain below 10%, but poorly maintained systems can lose between 20% and 30% of their air power. In some extreme cases, more than 80% of the air can be lost through leaks.

Compressed air systems are responsible for approximately \$5 billion annually in energy expenses, which represents a significant amount of wasted energy and money. In addition to higher energy costs, air leaks negatively affect compressed air users by reducing productivity and shortening equipment lifespan. So, it is necessary to estimate the amount of leakage in the pneumatic system for preventive actions. The energy cost for each leak can be calculated using the following formula:

Annual cost of leaks = Leakage rate (cfm) X kW/cfm X operating hours X \$/kWh

For compressors equipped with start/stop controls, estimating the amount of leakage in the system can be done quickly. This process involves starting the compressor without demands on the system and ensuring that all air-operated end-use equipment is turned off. Multiple measurements are taken to calculate the average time the compressor needs to load and unload. The compressor will cycle on and off due to air leaks, which cause a drop in pressure as air escapes. The total leakage, expressed as a percentage, can then be determined using the following formula:

Leakage (%) = $((T \times 100))/((T + t))$

Where: T = on-load time (minutes)

t = off-load time (minutes)

Leakage may be estimated in systems that use different control strategies if a pressure gauge is positioned downstream of the receiver. This approach involves estimating the system's total volume, including any downstream secondary air receivers, air mains, and piping (V, in cubic feet). The system should be brought to its normal operating pressure (P1, in psig) and allowed to return to this state. Afterwards, the time (T, in minutes) it takes for the system to drop to a lower pressure (P2, in psig), typically around half of the operating pressure, should be measured. The leakage rate can then be calculated using these measurements.

Leakage (cfm free air) = ((V × (P1-P2))/(T × 14.7) × 1.25

A multiplying factor of 1.25 is used to adjust for leakage to the normal system pressure, which reduces leakage when the system pressure decreases. If leakage exceeds 10%, it suggests a scope for system improvement. It is recommended that these tests be conducted every quarter as part of a routine leak detection and repair program.

Detecting air leaks:

Detecting air leaks in the compressor is essential for energy conservation and regular maintenance. The following methods are commonly used for air leak detection:

- **Listening:** This is the simplest and the most cost-effective method, relying on the ability to hear a hissing or whistling sound from the pneumatic line. However, this method only works for large leaks in easily accessible areas. It can be challenging to use in noisy environments, limiting its scope.
- **Soap water test:** This method involves applying soapy water to suspected leak points. If a leak is present, soap bubbles will form at the location of the air leakage. Although this method is simple, it is time-consuming and needs to provide more information on the size or volume of the leak.
- Acoustic method: The most effective and efficient way to detect air leaks is using acoustic imaging cameras. These cameras can identify leaks in various equipment, including pipes, valves, and pneumatic tools, even in noisy or hard-to-reach areas. Acoustic imaging allows testing while equipment runs and provides fast, accurate results.

Acoustic imaging process:

When pressurized gas leaks, it moves from a high-pressure laminar flow toward low-pressure turbulence, creating a vortex. As the vortex breaks, it radiates ultrasonic energy. Acoustic imaging cameras, equipped with an array of tiny, super-sensitive microphones, capture this energy and create a sound spectrum based on decibel levels per frequency. An algorithm then overlays a sound image onto a visual image, pinpointing the location and size of the leak. This allows for real-time analysis, enabling manufacturers to identify and fix leaks quickly.

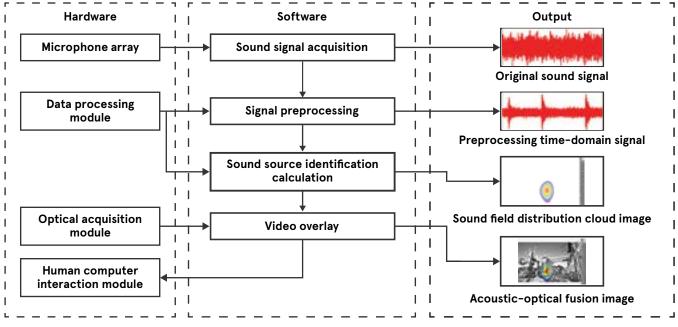

Figure 1: Functional diagram of acoustic imaging system

Multicomp Pro is excited to be celebrating its 5-Year Anniversary! When the brand was launched, our objective was to offer improved quality and value to electrical engineers at all stages of their projects—from prototype to production, and even for students.

Over the last 5 years, it's been wonderful to see the brand grow and continue to expand its product range. Even better has been the positive feedback from our customers, which reinforces our belief that Multicomp Pro is the Engineer's Choice.

John Casiello Global Marketing Multicomp Pro

multicomp PRO

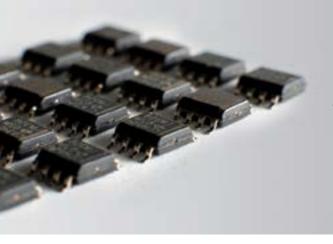

THE ENGINEER'S CHOICE For Quality & Value From Prototype to Production

Multicomp Pro understands that engineers require cost-effective, reliable solutions.

Regardless of if you are starting a prototype, in mass production or maintenance and repair operations, Multicomp Pro offers the electronic components and equipment that engineers need with the quality and value they require.

Terms & Conditions

- All products shown in this issue of Connect (the 'Publication') are subject to availability and all sales of these products are subject to element14's standard terms and conditions of sale as set out on element14 website. To obtain a copy, call 0800 90 80 80 or visit: nz.element14.com/terms-and-conditions
- The publication, products and prices are valid between 1st January and 31st March 2025
- All savings shown in the publication are against the prices on the element14 website (nz.element14.com) as of November 2024 and are subject to change
- Connect savings cannot be used in conjunction with any discount and/or offer
- Any further discount (special pricing, quote discounts, discount vouchers, etc.) is not applicable on Connect products
- Prices in the publication exclude delivery charges & GST. Prices are inclusive of any discount mentioned in the publication
- element14 reserves the right to withdraw any product from sale for legal or commercial reasons
- Changes may be made to products and prices by element14 and/or our suppliers
- The products in the publication are meant for business customers and consumers. By ordering, the customers confirm that they wish to obtain the supplies for their business or personal purposes and not for reselling
- While every effort has been made to ensure the accuracy of the information in the publication, element14 does not warrant the accuracy or completeness of the information and accepts no liability for errors in, or omissions from the publication, including those arising from our negligence
- Orders must be placed before 9 PM. For more details visit: nz.element14.com/help-delivery-information
